

We can manage your tool build from design to production. Using our partners in Czech or in Asia (depending on preference), we can take a tool to production in a very short space of time. Because of our long moulding experience we can reduce the trialling time that is normal in most new tool situations. We can advise the toolmaker on important characteristics like the optimum gate position, best venting positions and other important characteristics.

Then using our in-house toolmakers and equipment we can fully support the tool at the pre-production and production stage.

In certain circumstances we can allow for the cost of the tool to be amortized over a set period of time.

We produce on many complex automotive tools or extreme high gloss finish tools. So our technicians and engineers understand the best maintenance methods for each type of tool.

All production tool histories are maintained and filed. Records are kept of all issues that may arise with each tool.
